

Continuous Application Of Modern Logical And Literary Materials In The Formation Of The Competence Of Students To Work With Akhbotrot

Kozokboyeva Khanifakhan

Andijan State Pedagogical Institute

Master of Stage 2

Annotation: At the moment, the training of deeply and creatively thinking personnel in every possible way is an urgent topic, and it certainly begins with small elements. The methods and materials used in the elementary grades are no exception, and it is important that we teach the sources of the future that history knows, with a connection, zeroiki, there is no future without history. And through this article, it is shown that in increasing the competence of students to work with information, not only materials that encourage today's creative thinking are great, but also the role of shields from ancestors.

Keywords: Competence, logical materials, literary materials, informed society, didactics, traditional education.

Today, in the world educational standards, personnel are required who creatively approach each area, each topic and each concept, and are preparing for this, that is, students, starting with primary education. Education in Uzbekistan is no exception, and it is recognized that it is important to train competitive personnel in all respects. This creates the need to apply modern pedagogical technology on the formation of a positive attitude towards the environment. In world education, it is the main issue to find the most optimal solution aimed at improving the quality and efficiency of the educational process. In this case, the main focus is on creating a problem situation within the framework of educational materials, focusing on life issues, using various methodological elements for the development of the process of personality cognition, giving stimuli to the educational activities of learners. In the system of continuing education in our country, the continuity of students, that is, the individual perspective, is created, therefore, together with it, a comprehensively developed, independent-minded, underground point of life, the education of young people loyal to the motherland, in the process of deepening democratic reforms and developing civil society, it is permissible to dwell on their research work left over from our ancestors, a research approach, signs of its differences from other cognitive processes, signs of human-specific creativity and views on the factors that contribute to their development. Zeroiki, a person's interest in research goes back to their need for knowledge to increase their social activism¹ tasks such as defined. These tasks are intended to introduce scientific and creative methods for the development of research competencies in students to the process of literary education, to involve them in projects and experiments, to improve the mechanisms of a good approach to research activities.

If we count our alloma-yu wisdom, we can give an example to the field of education, namely, pedagogical education, and, from those who massively add to understanding, to the Imam - Bukhari and foreign scribes in our land. These scholars, whose education involves the inclusion of training through Labor, making decisions with reason in every work, and through their parables they encourage the reader to think logically. It consists in finding an independent solution to Vas hu muamolivaziyya, which determines the wrong thoughts for those, creating muamoliyats. We know that these scientists seem to be not exactly close to a topic, and in the guise of humans, in many cases, animal logos are used. This is the impetus for the development of creativeness, creativity in the student, that is, in the important things that are being scolded in modern education today. For example, in the PRLIS international test system, which is aimed at developing the ability to read and understand children in today's world, we have the same eyes on Matins. Referring to the Imam-Bukhari hadiths; in Hadith, each burden is matured only by the acquisition of knowledge and the result of high labor. Not only spiritually, but also morally, he rose to be beautiful. The great allomaningasars are distinguished from other literature lessons by the consecration of the reader into religion, and it is no exaggeration to say that we instilled the new age bilim into the minds of our disciples and scribes, connecting this with Karim, the weapon of our literary heritage. The creative heritage of Imam Bukhari amazes a person with its size, full coverage of the religious and Social Sciences of his time. During his visit to Samarkand region on April 14-15, 2017, President of the Republic of Uzbekistan Shavkat Mirziyoyev made an offer to build an international research center under the Imam Bukhari memorial complex, saying: "our great-grandfather, the leader of all muhaddis, Imam Bukhari mangu, has a special spiritual and spiritual atmosphere in this residence. Let the person who came to visit the complex also enter this center and receive a large amount of food for himself, get used to the wisdom of our ancestors. Then a feeling of pride in our great ancestors will develop in their hearts, at the same time a generation of such great breeds will feel their responsibility"².

Thus, the Hadith will strengthen the trust and faith of every believer and at the same time encourage the individual to spiritual perfection. Therefore, Hadiths are considered an important resource in the formation of a perfect person, and the use of it in the education of young people is considered one of the urgent tasks of this day.

Our other series of allomas are also of great importance in scientific methods of cognition. It was worth insisting that they have views within the framework of the problem under study. An example of this is the research work of Abu Rayhan Beruni. It enriched the teachings of Ahmad Al-Farghani and Muhammad AL Khwarazmi, who had created it before him, and conducted experiments in observed studies of allomas. In addition, issues of critical study and comparison are covered in order for the scientist to collect data, make generalizations based on them, determine the truth. The scientist believes that ... the most important of the means of conveying knowledge is the study of narratives about ancient peoples, messages about past generations. Because many of them he is a descendant of the nation, consisting of their figure - rule. By making a mental argument, comparing the observed, it is impossible to take messages. This is only known by comparing in-depth research with views of and

² <https://religions.uz/uz/news/detail?id>

different religious allomas. In general, the conclusion is formed that the knowledge we are currently studying is acquired from history not just one knowledge, but at the cost of studying different views, reaching their essence and, from this, comparing them only briefly, at the expense of in-depth research. Today's world of information, that is, in this period of rapid development of Science and technology, is becoming one of the pressing problems of receiving information and finding the necessary tools for making the right choice on this information. In particular, the decree of the president of the Republic of Uzbekistan dated February 2, 2019 No. 5653 "on the mountain of additional measures for the further development of the information sphere and Mass Communications, Based on the decree of the president of the Republic of Uzbekistan dated June 7, 2019 PQ-4354 "on further improvement of the provision of information waiting for the population of the Republic of Uzbekistan", it is important to create pedagogical methods and methods that make it possible to fully and creatively implement these information in a comprehensive state of modern information transmission for students in Because we know that the information environment of today's society and the rapid development of the labor market are growing on the basis of the old-time system that makes it old-fashioned for it. The demand for their falsification is increasing due to the fact that the information picture is growing in fast pictures. According to experts, working with information and communiqués, in addition to increasing the theoretical, creative, reflexive and intellectual potential of students, grows the effectiveness of their use of information. This in turn helps pedagogical personnel to increase their efficiency, competence.

We know that student competence creates a teacher, which is characteristic of the pedagogical competence of the teacher. The teacher will be able to organize, improve the lesson in a modern way, teach students to think independently and get out of problem situations, analyze them in search of information correctly and reasonably, think about students and Chish from problem situations. Logical materials informational knowledge helps to grow their minds as well as learning to work perfectly. This we can see in these; today, creative young people with logical thinking are in great demand, mathematical issues in the educational process, Matins also have their own logic.

It is known that in traditional lessons, a focus was mainly on grammar, and this did not allow independent work, free thinking. In today's modern lessons, however, work mainly on the matinee ,focusing on the awareness of information, relying on each of his words in the text, the information contained in it encourages the reader to think more deeply about this text and its content. In the elementary grades, especially in mathematics classes, there is an emphasis mainly on matinee, logical issues. A student listens to a given issue from a teacher, and then reads this issue independently to better understand its content. In this process, the child appears in a reflex way of focusing deeply on the hearing or, in relation to the information he is reading. This provides a positive assessment of the development of information competence in a child. Problem solving therefore also shows positive feedback on mental development in combination because it requires generalizations of mental operations such as analysis, synthesis and comparison.

The reader reflects on determining the inextricable relationship between the numbers given and the content of the text during the solution of the issue. My main issues will be with the universe that surrounds us, and this will prepare the reader for a market

economy. By solving issues, they get acquainted with information that is important in the field of knowledge and experience.

In conclusion, we can say that in order to prepare the specialists and personnel we need for us, we will have to develop them first, having their own independent opinion, so that we can draw logical conclusions on the subject. For this, of course, the place of research work and the results obtained from them, which we have applied in the period of knowledge of our allomas that have remained in history, is incomparable. However, the new era is logical and requires deep laying and searching, and materials that should not be overlooked either because the walking that is adjacent to the era is a requirement of the era.

Examples of these are matinee, logical issues, which are ranked from the international test system. We know that the international PRLIS test system teaches the reader to make a text, that is, to make information plausible. In this test system, mostly texts are permeated with logic, requiring students to think creatively. The main thing is that the competency approach to the educational process enrichment of educational content in order to achieve the goals of training is the sum of didactic and technological principles that allow organizing the educational process on the basis of innovative technologies and predicting results.
